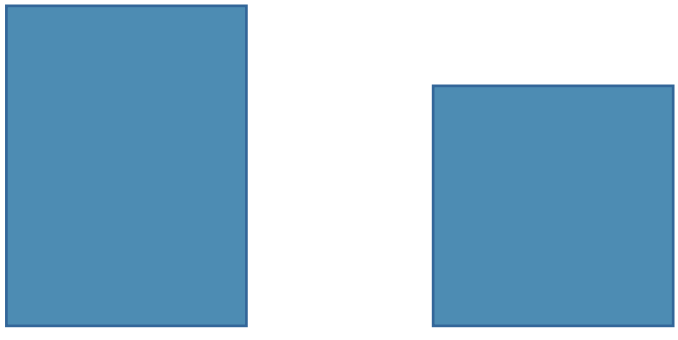
Bird counts on a fixed route

Both surveys used the same 600 m route at 07:00 for 30 minutes.
In week 1, observers counted 12 mallards, 5 moorhens and 8 coots.
In week 2, they counted 9 mallards, 5 moorhens and 6 coots.
The total fell from 25 to 20. Moorhen count stayed at 5, while its share rose from 20% to 25% because the total became smaller.

Week 2 was windy. Wind can change how many birds observers detect.
Two counts alone do not establish a population decline or a cause.
Count each bird once; repeated sightings on the same route are not new birds.

Mallards observed



Week 1: 12 Week 2: 9

Bar height shows observed count, not detection probability.
